

Getting started

From download to your own team's report in about 5 minutes. No coding, nothing to install except Power BI.

You need Windows. Power BI Desktop only runs on Windows. On a Mac, use a Windows PC or a Windows virtual machine (for example Parallels).

1. Install Power BI Desktop

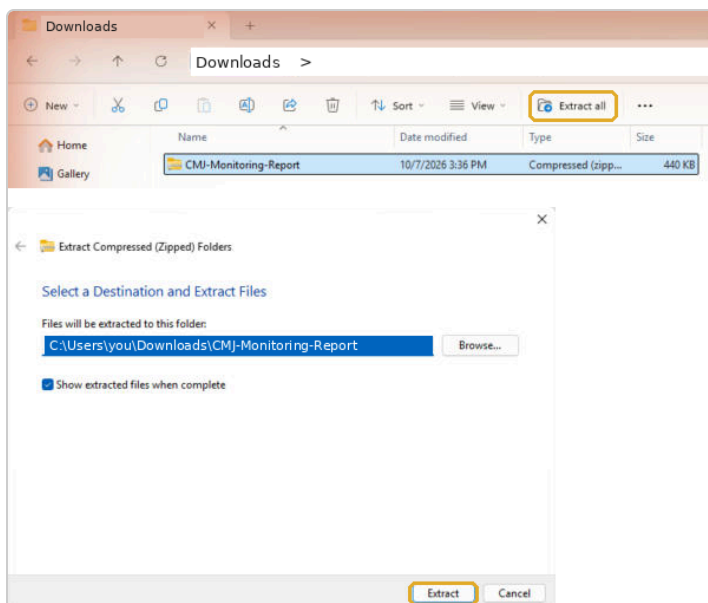

It's free: [Power BI Desktop](#) (or search "Power BI Desktop" in the Microsoft Store).

2. Download the report

Click **Download the latest version** from the GitHub page (Releases) and download **CMJ-Monitoring-Report.zip**.

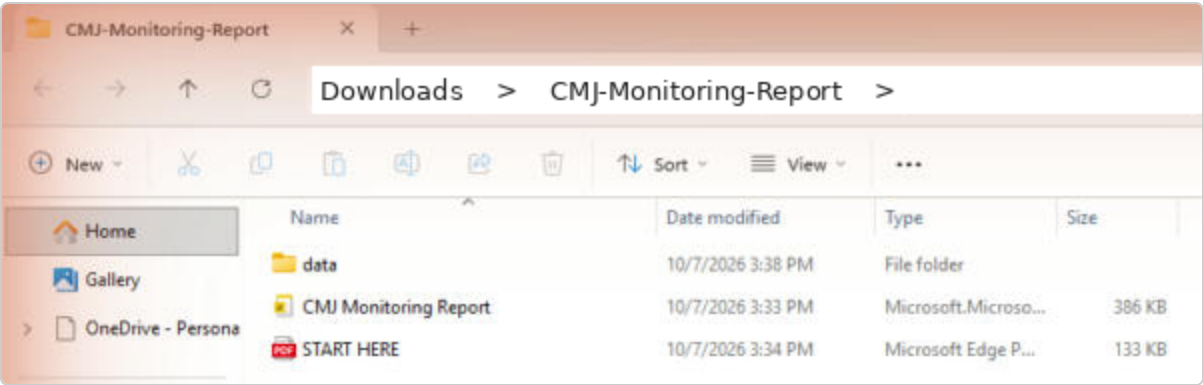

Screenshot added when the first release is published

Right-click the zip → **Extract All** → choose somewhere easy, like your Documents folder.

You get one folder:

```
CMJ-Monitoring-Report/
├─ CMJ Monitoring Report.pbit  the report
├─ data/                      put your CSV exports here
└─ START HERE.pdf             this guide
```

3. Export your CMJ data

Export your countermovement jump tests as a **CSV** and save the file into the **data** folder.

Before you export, set up your export template (VALD Hub) or export settings (Hawkin) so the CSV includes these columns. The names are what each system calls them.

Required: the six metrics, plus who and when

Report metric	VALD ForceDecks (VALD Hub)	Hawkin Dynamics
Athlete	Name	Name
Test date	Date	Date
Jump height	Jump Height (Imp-Mom)	Jump Height
Peak power / body mass	Peak Power / BM	Peak Relative Propulsive Power
Positive impulse	Positive Impulse	Positive Impulse
Contraction time	Contraction Time	Time To Takeoff
Eccentric duration	Eccentric Duration	Unweighting Phase and Braking Phase (the report adds them together)
Countermovement depth	Countermovement Depth	Countermovement Depth

Recommended: asymmetry and body weight

Report metric	VALD ForceDecks (VALD Hub)	Hawkin Dynamics
Eccentric (braking) asymmetry	Eccentric Braking Impulse % (Asym)	L R Braking Impulse Index
Concentric (propulsive) asymmetry	Concentric Impulse % (Asym)	L R Propulsive Impulse Index

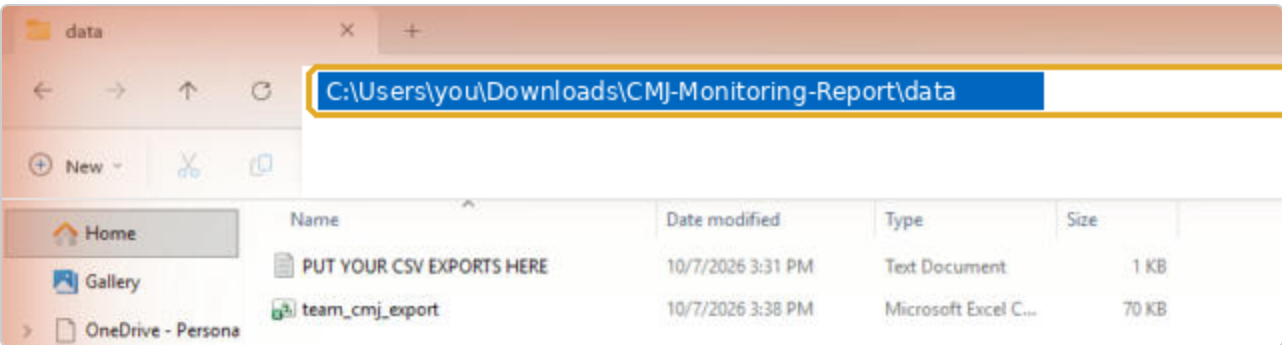

Report metric	VALD ForceDecks (VALD Hub)	Hawkin Dynamics
Body weight	BW [KG] (or Bodyweight in Pounds)	System Weight
Test type (only if the file holds other tests too)	Test Type	Type

Good to know:

- **Any units work.** cm, inches or metres; ms or seconds; kg, lb or newtons. The report converts them.
- **Extra columns are fine.** Anything not in these tables is ignored.
- **A missing metric doesn't break anything.** That column stays blank and the athlete is scored on the rest. VALD's **Eccentric Duration** isn't in every export template, so check it's there.
- **Hawkin exports every rep.** That's fine: the report drops any rep more than 10% below that day's best jump and averages the rest into one value per test.
- **Only bilateral CMJs are used.** If your export also has single-leg jumps, IMTPs or other tests, they're skipped automatically.

4. Copy the data folder's path

Open the `data` folder, click the address bar at the top of the window, and copy it (Ctrl + C).

5. Open the report

Double-click `CMJ Monitoring Report.pbix`. Power BI opens and asks for three settings. The boxes start empty, so fill in all three:

Setting	What to enter
DataFolder	Paste the path you copied (Ctrl + V).
AnonymizeNames	<code>false</code> to see your athletes' names, <code>true</code> to show <code>athlete_01</code> , <code>athlete_02</code> ... (handy for screenshots).
ExportCulture	<code>en-US</code> if your dates are MM/DD/YYYY, <code>en-GB</code> if they are DD/MM/YYYY.

Click **Load**. The first load takes a minute or two for a full season.

CMJ Monitoring Report

CMJ Monitoring Report for VALD ForceDecks or Hawkin Dynamics. DataFolder: paste the path of your CSV export, or of a folder of exports (on Windows: Shift + right-click the file > Copy as path). Leave it blank to see the demo data. AnonymizeNames: true shows athlete_01, athlete_02 instead of names. ExportCulture: en-US for MM/DD/YYYY dates, en-GB for DD/MM/YYYY.

DataFolder

C:\Users\you\Downloads\CMJ-Monitoring-Report\data

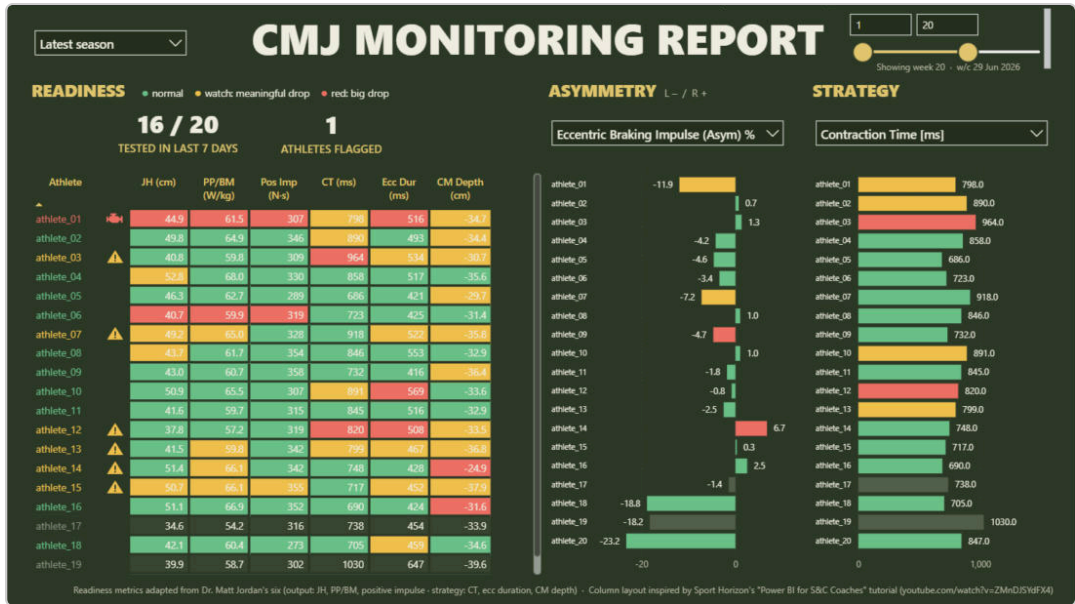

AnonymizeNames

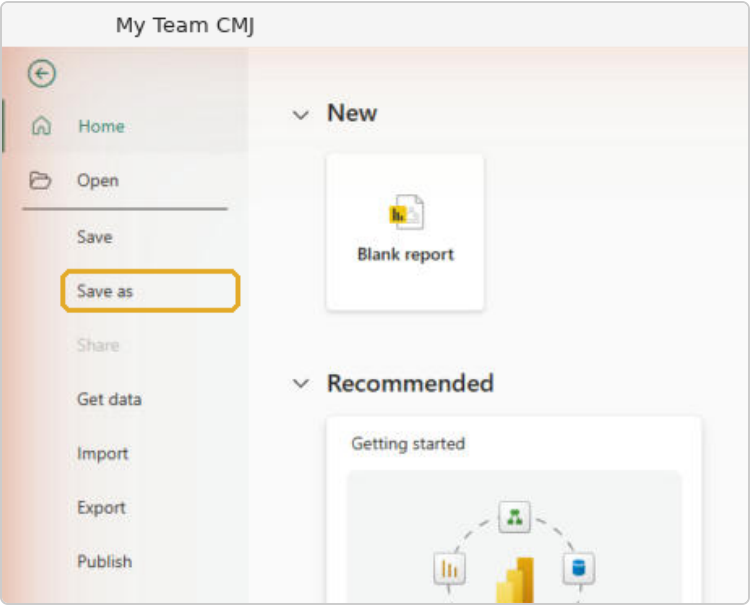

false

ExportCulture

en-US

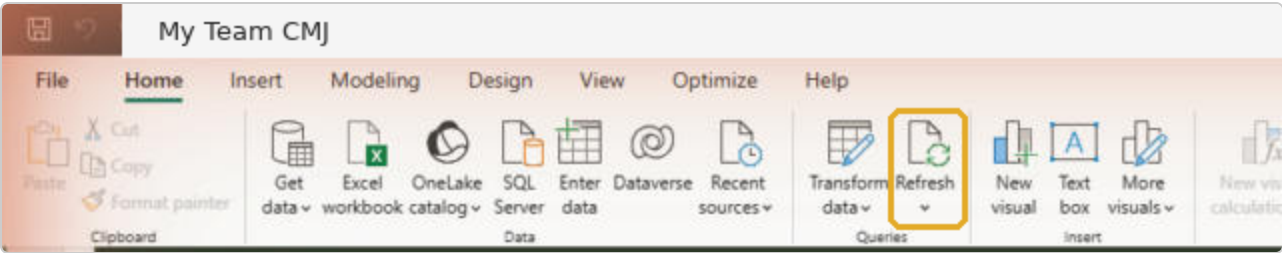

Load Cancel

Every week after that

1. Export the new tests and save the CSV into the data folder.
2. Open your saved report.
3. Click **Refresh** (Home tab).

That's it. Old exports can stay in the folder; tests that appear in more than one file are only counted once.

If something goes wrong

What you see	What to do
"No CMJ exports found"	The path doesn't point at your CSV or the folder holding it. Copy the path again (step 4) and set it under Transform data → Edit parameters → DataFolder .
A column is blank (often eccentric duration on VALD)	That metric isn't in your export. Add it to your VALD Hub export template and export again.
Dates look wrong (tests in the wrong month)	Change ExportCulture under Transform data → Edit parameters .
"Some of the tables have incomplete or no data"	Click Refresh now on the yellow bar. Big files sometimes need a second refresh.

Want to know how the scoring works, or tune it to your team? See the main README on the GitHub page.
